

UNIVERSITY OF LEEDS

The Leeds Dactylitis Index (LDI)

The Leeds dactylitis index (LDI) is a tool for measuring the activity of dactylitis in psoriatic arthritis. Dactylitis is a key feature of this disease, a poor prognostic marker, and a target for treatment.

The Leeds dactylitis index (LDI) is a tool for measuring the activity of dactylitis in psoriatic arthritis. Dactylitis is a key feature of this disease, a poor prognostic marker, and a target for treatment. Almost all new pharmaceuticals tested for psoriatic arthritis are tested against this metric. It incorporates a measurement instrument (dactylometer – currently manufactured outside the University) and utilises an algorithm for calculation of the index. A guide for the LDI is available.

LDI Full vs LDI Basic:

- LDI Basic: A simplified version designed for quick clinical assessments. It records presence of dactylitis, digit circumference, and tenderness, without requiring score calculations. Ideal for routine use.
- LDI Full: A comprehensive tool originally developed in UK English and later adapted into US English. It includes detailed instructions and a scoring formula. Suitable for research and clinical trials requiring more detailed analysis.

Commercial Licences:

If you are interested in using the LDI for commercial purposes, including clinical, organisational, or consultancy applications, please get in touch to discuss licensing options. We offer licence agreements to suit different commercial needs.

Contact us at enquiries@licensing.leeds.ac.uk to begin the conversation about commercial licensing.

Academic/Research Licences (available to order):

The LDI Basic was originally developed in UK/English. It is available for academic and research purposes under the following terms:

- Original UK/English version: Free of charge for academic/research use only (i.e. strictly non-commercial purposes).

Translations:

Arrange your own translation of the original UK/English version (subject to licence terms), or
